

Build dashboard with Data

All metrics pulled from backend endpoints

Navigation: Every stat card is clickable → routes to filtered leads page
Every “Reply” button → opens inbox with that lead
Every action button → routes to correct page or opens modal

Performance : No full reloads Use cached queries Load data in parallel

Real-time: Poll every 30s for updates (MVP)

We need the dashboard to be action-driven, not just analytics.

Every button should take the user to the exact place to act immediately.

Routing:

“Reply Now” (Priority + Hot Leads) → Go to Inbox → Open that specific lead conversation
“Send Confirmation” → Go to Inbox → Auto-fill confirmation message for that lead
“New Lead / Start Conversation” → Open Add Lead modal OR new conversation screen
“Launch Campaign” → Go to campaign builder flow
“Import Leads” → Go to CSV import flow
“Connect CRM” → Go to integrations page
“Manage” (Follow-ups) → Open that automation

in Automations page “Resume” → Resume automation instantly
(no page change)

Important:

Use deep linking (lead_id, filters, etc.) Inbox is the core destination
for all messaging actions. No dead buttons Keep everything fast
(no reloads if possible)

Goal: user logs in → sees tasks → clicks → closes deals
immediately

Estimated pipeline value

We need to implement pipeline value with both default and per-lead flexibility.

Requirements:

- Add “Average Deal Price” in onboarding + settings
- Use this value as default for all leads
- Add optional “Estimated Price” field per lead
- If lead has value → override average
- If not → use average deal price \$400k
- Combine with stage probability + commission for pipeline calculation 2.5%

Goal:

Make pipeline value accurate but frictionless for users.

for each lead:

if lead.price exists:

price = lead.price

else:

price = user.average_deal_price

probability = get_probability(lead.stage)

commission = user.commission_percent

lead_value = price * probability * commission

pipeline_value = sum(all lead_value)

Dashboard metric definitions:

1. Deals in Progress Count active deals/opportunities where status is not closed won/lost/archived.
2. Appointments Today Count appointments whose start_time is today and status is scheduled or confirmed.
3. New Warm Lead Count leads created in selected date range where temperature = warm. Warm can be manual or rule-based.
4. Follow Ups Sent Count outbound messages in selected date range where category = follow_up and delivery_status = sent.

5. Appointments Booked Count appointments created in selected date range where status is scheduled/confirmed/completed.
6. Responses Count inbound messages received in selected date range. Optional sub-metric: number of unique leads who responded.

Important: Use real database counts, not hardcoded numbers. Track all changes through activity logs/events. All messages should have direction, category, channel, sent/received timestamps, and delivery status. All leads should support temperature/status fields. Appointments and deals should each have clear statuses.

Priority Actions should be dynamically generated from system data, not stored.

We need 3 main action types for MVP:

1. New Warm Lead waiting for response
 - Trigger: lead created + no outbound message sent yet
1. Leads waiting for reply
 - Trigger: last message is inbound + no response after
1. Appointment needs confirmation
 - Trigger: appointment within 24 hours + not confirmed

Each action should return:

- type
- lead_id
- title
- description
- priority (high/medium)
- CTA (reply now / send confirmation)

Sort actions by priority and time.

Do not store these as tasks. Compute them in real-time from leads, messages, and appointments tables.

Hot Leads should be dynamically calculated based on engagement.

A lead is considered HOT if they have recent engagement activity such as:

- inbound message
- link click

- appointment interaction

MVP Logic:

- If a lead has inbound message or engagement in last 24 hours → mark as hot

Sort hot leads by:

- most recent activity
- highest engagement

Return:

- lead_id
- name
- last activity
- score (optional)
- CTA (reply now)

Performance Overview

should be a funnel using the selected date range.

Metrics:

1. Leads Count new leads created in selected date range.
2. Replies Count inbound messages from leads in selected date range.
3. Conversations Count unique leads/conversations with both outbound and inbound messages (true 2-way conversation).
4. Appointments Count appointments created in selected date range with status scheduled, confirmed, or completed.
5. Closings Count deals with status closed_won where closed_at is in selected date range.

Important:

- All metrics must use the same date range filter.
- These should be calculated from real database records, not hardcoded.
- Dashboard should support today / 7d / 30d / this month.

Active Follow-Ups should be tracked from workflow enrollments, not from general messages.

Data model needed:

1. follow_up_workflows
 - stores each follow-up campaign/sequence
1. follow_up_workflow_steps
 - stores each step/message in sequence
1. follow_up_enrollments
 - stores each lead enrolled in a workflow
 - tracks status: active, paused, completed, stopped_due_to_reply, unsubscribed, canceled
1. follow_up_step_runs
 - stores each scheduled/sent/skipped/failed message step

Dashboard logic for each workflow row:

- active count = enrollments with status active
- paused count = enrollments with status paused
- completed count = enrollments with status completed
- stopped count optional for reply/unsubscribe cases

A lead should remain active in a workflow until:

- all steps complete
- workflow is paused
- lead replies and automation stops
- lead unsubscribes
- user manually removes them

Recent Activity should be powered by a central activity_logs table.

Every major system event should create an activity log entry:

- lead created/imported
- inbound reply received
- outbound message sent
- follow-up sent
- appointment booked/confirmed/canceled
- deal stage changed
- deal closed won/lost
- workflow started/paused/resumed/completed

Activity log fields:

- id
- workspace_id
- lead_id nullable
- user_id nullable
- type
- title
- description
- metadata json nullable
- created_at

Dashboard logic:

- query latest activity_logs by workspace
- order by created_at desc
- show newest 5–10 items in Recent Activity section

Important:

- activity logs should be created by backend after the action succeeds
- do not hardcode feed items

Ai Follow Up Engine

Include Start conversation

Launch campaign

Import leads

FREE USERS (IMPORTANT)

SHOW upgrade INSIDE the AI Follow-Up Engine

Because that's your core value feature

Example:

 Upgrade to unlock:

- Unlimited follow-ups
- AI reply suggestions
- Advanced automation

 [Upgrade Now]

Three buttons underneath

Start conversation

Send users to inbox to start a conversation

Launch campaign

Sends user to campaign page to create campaign

Import leads

Allows user to import leads

PAID USERS

YES — still show upgrade (but differently)

Never remove upgrade completely.

Instead:

If on Starter (\$49):

Show:

 Upgrade to Growth

Get:

- More SMS/email limits
- Advanced AI replies
- More automations

 [Upgrade Plan]

AI Follow-Up Engine (SMART placement)

Instead of strong CTA, show:

For Growth user:

 Want more scale?

Upgrade for:

- higher follow-up limits
- advanced AI replies

 small button: “View Plans”

1. Sidebar / Settings

Keep:

 Billing tab always visible

Inside billing:

- show current plan = Growth
- show next tier (Pro / Team / Enterprise)

Example:

Current Plan: Growth

Need more? Upgrade to Pro for:

- higher limits
- team features
- advanced AI

 [Upgrade Plan]

2. AI Follow-Up Engine (SMART placement)

Instead of strong CTA, show:

For Growth user:

 Want more scale?

Upgrade for:

- higher follow-up limits
- advanced AI replies

 small button: “View Plans”

Where to place it

For users on Growth plan:

- Do not show aggressive upgrade CTAs across dashboard
- Keep Billing tab available at all times
- Show soft upgrade prompts in:
 - AI Follow-Up Engine section
 - Billing page
- Only show strong upgrade prompts when:
 - user reaches or approaches usage limits
 - user tries to access locked features

Optional:

- show small “Upgrade” link near plan name (subtle)

Best placements:

1. Inside AI Follow-Up Engine (small card)
2. Bottom of dashboard
3. Billing page (main upgrade page)
